

ENVIRONMENTAL STATEMENT

CF211 DUST CONTROL AGENT

Hammersley Products (Aust) Pty Ltd. have been developers and manufacturers of high-quality industrial specialty products for over 40 years.

In the matter of the use of CF211 wetting agent for the purpose of dust suppression in the mining of iron ore, we are able to assert the following:

- CF211 is a blend of biodegradable, organic surfactants.
- It is designed to significantly reduce the surface tension and the wetting efficiency of water at a usage rate of 0.1%
- It is non-hazardous and requires no special handling precautions
- Spraying the diluted product provides no negative effects on eyes, skin or the respiratory system
- At the levels of proposed use or at a level significantly higher there is no ingredient that has any potential to harm or interfere with the downstream processing of the mineral ore.
- Biodegradable end products would essentially be elemental or simple compounds of hydrogen, carbon and oxygen
- Exposure to high-temperature ignition would result predominately in a carbon residue that would be free of oily or greasy contaminations
